Brunei Palace

Award Winning Energy Saving and Asset Protection Coatings

GEOGRAPHICAL AREA:

Brunei Darussalam

ISSUE:

Mold growth on the exterior marble Palace Walls was causing extensive maintenance costs to keep it clean.

SOLUTION:

Energy ProtectTM thermal insulation & mold resistant coating.

Coverage: 2-coats

RESULTS:

- ✓ Eliminated mold growth on the palace walls.
- ✓ Provides protection against the harsh salt air environment.
- ✓ Did not change the look of the beautiful marble that it was protecting

The maintenance team at Istana Nurul Iman, the residential palace in the country of Brunei, had been searching for many years for a solution to the continual mold growth on the palace walls.

The palace performed a year-long study of the Energy ProtectTM coating for resistance to mold growth. Energy ProtectTM was coated on the three lower tiles in the photo on the next page, and after a year proved to be resistant to mold growth in this extremely humid climate.

The tiles coated with Energy ProtectTM remained free of mold growth, while the untreated tiles were once again covered with mold growth.

After the successful completion of the study, the Palace arranged for the application of 2-coats of Energy ProtectTM for mold resistance to be applied to the extensive area of its marble palace walls.

In addition to keeping mold from forming on the palace walls, which greatly reduced their maintenance costs, the coating also provided protection against moisture penetration, damaging UV rays and deterioration as a result of the salt air, all while remaining invisible, which allowed the beauty of the palace to shine through.

ADDITIONAL PHOTOS

Award Winning Energy Saving and Asset Protection Coatings

The entire wall was cleaned and the three lower tiles were coated with 2 coats of Energy ProtectTM coating. After 1-year this photo was taken. The coated area was still free of any mold growth, while mold had returned as usual to the untreated marble areas.

Project Team, happy with the success.
